

# WINTERGREEN COUCH

(Cynodon dactylon)

## WHY CHOOSE WINTERGREEN

- High quality and density, medium to fine leaf textured turf
- Exceptionally soft and spongy under foot
- Dark green colour
- Strong root growth
- Hard wearing surface all year round

### Cold Tolerant

Colour retention in cooler months

### Average Traffic Tolerant

Extremely hard wearing

### Required Sunlight

Min. 6 hours of direct sun daily

## ABOUT THIS TURF

Wintergreen is an olive/green colour semi-dwarf, fine leaved improved version of common Couch.

It was released commercially in 1986. It is suitable for household lawns, playing fields, parks, roadsides, golf tees and fairways, and has even been used on tennis courts.

It is a versatile turf which requires full sun, and with its deep root systems and rhizomes, it is an ideal hard wearing turf.

Wintergreen Couch is a good general couch turf that can require more frequent mowing due to thatch build-up. It grows best in full sun, requiring at least 6hrs of sunlight per day. It can be cut to a height as low as 6mm.

It is a little more erect in shoot habit, more prolific in seed head production, and a little finer in leaf texture than other green couches.

Wintergreen's maintenance requirements (pests, diseases, etc) are relatively low. It is best mown at about 15-25 mm height, but can be cut as low as 6 mm.
